**Folding chassis for babies' pushchairs.**

This chassis is the type which comprises a handle (1) mounted such that it slides down over the front legs (4) by means of a guide clamp (9) to which the top end (10) of the corresponding rear leg (11) is jointed. The chassis is fitted with articulated means of supporting either a seat or a carry-cot, consisting of a U-shaped member (8) which articulates (6) at one end of its arms (7) with the upper end of the front legs (4), and at the other end (12) of its arms with the bottom part of the rear legs (11). The long rods (14) which serve to hold the seat or carry-cot are jointed at their rear ends (13) to the top of the arms (7) of the U-shaped member (8), said long rods (14) being supported and articulated by respective struts (15) which are jointed, below, to the top of the rear legs (11).

EP 0 483 042 A1

There are different types of folding chassis for babies' pushchairs, among them some which have the inverted U-shaped handle mounted such that it slides down over the front wheel-bearing legs and which are folded by pushing the handle down, as is the case with the pushchair chassis referred to in Spanish utility model No 289.442 belonging to the same applicant firm.

More specifically, the chassis this invention relates to is an improvement on the one pertaining to Spanish Invention Patent No P8603325, the handle of which slides up and down the front legs via a guide clamp to which is jointed the top end of the corresponding rear leg, this improvement enabling the chassis to be fitted very simply with either a seat or carry-cot.

Thus, the ends of the arms of a U-shaped crossmember are articulated at the top ends of the front legs, this crossmember being jointed at the lower ends of its branches to the middle section of the back legs.

Two long rods are jointed at their rear ends to the upper part of the U-shaped member's arms, their purpose being to act as a support for the seat and/or carry-cot, which is fitted to them via the appropriate means.

These long rods rest respectively, at their front ends, on struts which are jointed, above, to said ends and, below, to the top part of the rear legs.

This chassis is fitted on each side with a hook-type retainer device at the top of the front legs, which retainers clip on to pivots fixed to the arms of the handle in order to lock the chassis in its unfolded position, and each having its respective knob for unlocking at the sides.

These and other characteristics will become clearer from the detailed description below, which is further facilitated by two sheets of drawings representing an embodiment given only as a non-limiting example of the scope of the invention.

In the drawings:

Figure 1 shows, in perspective, the pushchair chassis unfolded,

figure 2 shows an elevation of this same chassis folded,

figure 3 shows a cross-section of the retainer assembly on the front leg, and

figure 4 is an overhead view of said assembly.

In accordance with the drawings, the chassis comprises a U-shaped handle 1 with parallel arms 2, and a grip 3 in the middle section, this handle structure being mounted such that it slides up and down the front legs 4, through guide clamps 5 (figure 2) to which the top ends of the arms 7 of a U-shaped crossmember 8 are jointed by means of a pin 6.

Just a bit further down from the clamps 5, the handle arms 2 are jointed to other guide clamps 9 through which the front legs 4 slide and to which the top ends

of the rear legs 11 are jointed by means of a pin 10, the lower part of the arms of the U-shaped member 8 being jointed by means of pins 12 at the lower ends of said rear legs.

The rear ends of the lateral long rods 14 articulate via a pin 13 to the top part of the arms 7 of said U-shaped member, the front ends of these long rods articulating with and being supported by respective angle struts 15 which at the lower ends are jointed to the top of the respective rear legs 11.

These long rods are fitted with means 16 and 17 for the detachable mounting of a seat or carry-cot, or a seat which can be converted into a carry-cot.

To make it safe in the unfolded position, this chassis has a retainer device 18 (figures 3 and 4) fitted on each side, which consists of a U-section hook 19 articulated via pin 20 to the top part of the front legs 4, which hook clips round a lug 21 jointed to the underside of handle arms 2, the hook being pushed against the lug by a helical spring 22 which surrounds the pin 20 and rests, respectively, on the leg 4 and the part forming the hook 19, which part extends along arm 23 opposite the hook to end at a knob 24 which, when pressed manually, serves to unlock the retainer devices and thereby allow the chassis to be folded. The handle arms 2 incorporate, further up from the lugs 21, some more lugs 25 as safety members to guard against accidental folding of the chassis should the retainer happen to fail with regard to lugs 21.

The chassis is also equipped with a wire tray 26 which is fitted, at its front and rear, to a bottom crossmember 27 that joins the front legs 4 and the middle section of the U-shaped member 8, respectively.

The invention, in essence, may be given other embodiments differing only in detail from that shown as an example, which would also be covered by the protection applied for herein.

## Claims

1. A folding chassis for babies' pushchairs, of the type comprising a handle (1) mounted such that it slides down over the front legs (4) by means of a guide clamp (9) to which is jointed (10) the top end of the corresponding rear leg (11), characterised in that the top ends of the front legs (4) are articulated (6) to the ends of the arms (7) of a U-shaped crossmember (8), which is also articulated (12) at the lower end of its arms (7) to the middle part of the rear legs (11), two long rods (14) being jointed at their rear ends (13) to the top of the arms (7) of said crossmember (8) in order to take a seat and/or carry-cot, each of these long rods (14) being supported at its front ends by respective struts (15) which articulate above with said ends and below with the top part of the rear

legs (11).

2. A folding chassis for babies' pushchairs, according to claim 1, characterised in that the top part of the front legs (4) includes hook-shaped (19) retainer devices (18) with a knob for unlocking (24) on the side, which clip round respective lugs (21) joined to the arms (2) of the handle (1) for the purpose of locking the chassis in its unfolded position.
